

GREEN PARKING – The environmentally responsible decision where parking is concerned

- For small footprints
- Significantly reduced use of climate-damaging concrete through using of steel structures
- No space-intensive ramps and driving lines required
- No expensive illumination and ventilation necessary
- With the same amount of space, up to 50 % or more parking spaces than in conventional car parks and underground garages
- More green areas
- Safe for users – no dark stairs and parking spaces
- Safe for vehicles and bicycles – no parking crashes or theft
- Smart charging management for electric vehicles on the parking pallets
- Durable parking system technology and low maintenance costs
- No traffic looking for a parking space – less amounts of CO₂ and no stress for users
- For tower versions, possible greening or photovoltaic systems on the façade
